

Amateur radio continues serves the people of the United States well by providing pro bono public service and emergency communications. The only costs to the government are the minimal administrative costs of regulating the amateur radio service and the use of a portion of the radio frequency spectrum. This proposal to allow parcel carriers and others to increase the signal density and duty cycle of their ID systems puts the use of the 70cm amateur allocation at serious risk. The mobile nature of parcel carriers would make identification of interfering systems virtually impossible. Under current limits that makes cooperative spectrum sharing difficult. Under the proposed changes it would make it impossible.
